FRAMEWORK

The Intelligent Transportation Systems, or abbreviated, ITS, has been developing rapidly, particularly since the 80s, being nowadays in the world's agenda of all countries and of all political leaders, managers and decision makers in the transportation sector, covering all modes of transport, as well as the area of logistics.

This development is due to the increasingly need to meet the great challenges faced by today's society, namely concerning energy costs reduction and CO² emissions, operational efficiency, competitiveness growth, safety and services quality.

There are, throughout the world, many experiences and countless situations, for which ITS already gave a valuable contribution and there is still a remarkable effort and investment in research and development of optimized solutions.

To evaluate the opportunities offered by ITS, to follow the developments obtained and to discuss the perspectives which emerge, are enriching and decisive factors, for which this Conference aims to decisively contribute.

OBJECTIVES

At the end of the conference, participants should be able to recognize that it has contributed to:

- > Promote the exchange of ideas and sharing of knowledge, in the area of intelligent systems applied to the logistics and transport, in order to disseminate information and expertise which may contribute to the adoption of adaptive solutions to specific contexts of different countries, regions or institutions;
- > Disclose pilot projects and demonstrations using services, systems, products and intelligent technologies in logistics and transport, disseminating their results.

TARGET POPULATION

Political and business decision-makers, senior officials of public administration and companies, researchers and academics, connected, directly or indirectly, to the areas of logistics, transport and information system and technologies, especially of Portuguese-speaking Countries.
